Glenbrook Farm

About Us

Matt started raising commercial Katahdin sheep in 2008 on his parent's farm. In 2009, he sold that flock and bought a registered flock of Katahdins and moved them to the current farm location. In 2013, he joined the National Sheep Improvement Program which provides estimated breeding values to select animals using data. In 2018, he added a small flock of White Dorpers from Paul Lewis in Oregon. He also added a few Romanovs that same year. In 2022, we added Texels from the West Virginia University flock dispersal which brings our current ewe flock to approximately 130 Katahdins, 30 White Dorpers, 50 Romanovs, 20 Texels and 100 commercial ewes. In 2025, we added 5 East Friesian sheep to milk.

Our goal as a farm is to use data and visual appraisal to breed sheep that excel in commercial sheep production. For any questions please contact Matt Nolt at **(717) 419-1980**.

Thank you for your interest in our sheep!

Matt and Katie Nolt

NSIP EBV and Indexes Descriptions

BWT: Birth Weight EBV (kg) estimates direct genetic effects on weight at birth. Positive selection is anticipated to increase birth weight and have correlated positive effects on early lamb survival, especially with twins and triplets. Negative selection is anticipated to reduce birth weight and lambing difficulty associated with oversize lambs, especially in singles.

WWT: Weaning Weight EBV (kg) provides an estimate of preweaning growth potential and will likely receive positive selection emphasis in most flocks.

PWWT: Postweaning Weight EBV (kg) combines information on preweaning and postweaning growth to predict genetic merit for postweaning weight at 120 days. Positive selection is expected to favor rapid growth to typical market ages.

NLB: Number of Lambs Born EBV evaluates genetic potential for prolificacy. Expressed as numbers of lambs born per ewe lambing. Ewes with +0.10 are expected to have an average of 0.10 more lambs at each lambing than average ewes and their daughters are expected to have an average of 0.05 more lambs at each lambing compare to daughters of average ewes.

NLW: Number of Lambs Weaned EBV evaluates combined ewe effects on prolificacy and lamb survival to weaning. Expressed as number of lambs weaned per ewe lambing. Ewes with 0.10 are expected to wean an average of 0.10 more lambs at each lambing than average ewes, and their daughters are expected to wean an average of 0.05.

MWWT: Maternal Weaning Weight EBV (kg) estimates the genetic effects of the ewe on the weaning weight of her lambs (a measure of the ewe's merit for mothering ability). Mainly reflects genetic differences in ewe milk production. Ewes whose lambs grow faster than predicted are assumed to be better milk producers, those that grow slower are assumed to produce less milk.

Scrapie Genotype Resistance Descriptions

RR — Resistant **QR** — Moderately Susceptible **QQ** — Highly Susceptible

Scrotal Circumference: Rams with larger scrotal circumference tend to produce more semen of greater viability and tend to sire daughters that reach puberty earlier and ovulate more eggs.

I bought this sire from Fox Valley Katahdins. His grandsire was our Glenbrook 666 ram. He is a nice long ram with good growth and MWWT. His offspring should work well for flocks that don't want a lot of triplets.
